

## COVID-19 Tubing Capabilities

As the COVID-19 virus spreads across the world, we here at Finger Lakes Extrusion are ready to help in the fight. We are manufacturers of flexible plastic tubing that can be used in a variety of medical applications.

Our current customer base uses our tubing for ventilators, respirator testing equipment, irrigation fluid management systems, wound healing equipment, CPAP machines, dialysis centers, nebulizers and various other medical applications. With that being said we are very familiar with the requirements of the industry: tight tolerances, high quality level, certifications, lot control, documentation and clean room ready products.

Customizing is our specialty; abilities include double bagging, plastic reels, cut to length, color, print, bar coding and much more. Finger Lakes Extrusion is an ISO 9001:2015 registered company and takes quality very seriously. Our products meet various industry standards including USP VI, FDA, NSF-51, USDA and 3A.

This pandemic requires ventilators for the sickest of patients. ClearFLEX 60NP and EtherPURFLEX 84 are currently being used as ventilator circuit tubing. These two materials are only a few of the possible materials that could be used to create your ventilator circuit. Whether you have an established unit and are looking for more supply or you are developing a new product due to the need; we can help you.

Most hospitalized patients also require IV medicine and fluids along with Oxygen. We can also supply this tubing as the need is soaring and current supply can't keep up. IV tubing and Oxygen tubing can be supplied on bulk spools to be cut down and assembled as part of a sterile kit or cut to length depending on your needs. We recommend ClearFLEX 60NP for this application and are ready to begin production of your product quickly.

Hand Sanitizer is also in an extreme shortage. Many breweries and distilleries have transitioned their production facilities from consumption alcohol to sanitizing alcohol. We can supply tubing for the dispensing units of the hand sanitizer and the transfer of the raw materials during the production process. We would recommend our PolyFLEX 50 product for this application.

We understand that fast turnaround times during a crisis like this are vital and we are here to meet those needs.
