

Vacuum Chamber Solutions

World's broadest portfolio of polymer solutions for use in vacuum chamber applications

Typical Process Tools: Etch, CVD, PVD and Ion Implant

Material Solutions and Key Properties

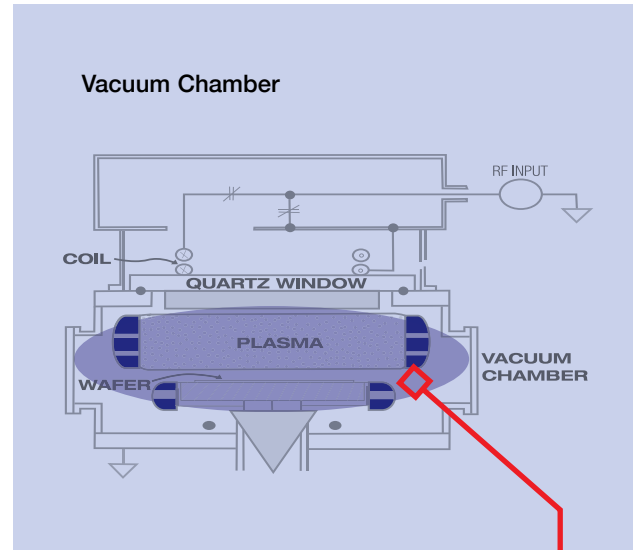

- **Ketron® 1000 PEEK**
For use in lower power, lower heat (300°F) or indirect plasma chamber applications such as wafer mobility.
- **Duratron® T4203 PAI**
For use in medium power, medium heat (500°F) applications or indirect chamber applications in presence of Oxygen plasma.
- **Duratron® CU60 PBI**
For use in high power, high heat (750°F) applications or indirect chamber applications when in the presence of Oxygen plasma.
- **Semitron® MPR 1000**
For use in high power, medium heat (520°F) applications. Best in class when in presence of Oxygen plasma.

General Trends

- Increasing energy in plasma chambers.
- More aggressive plasma chemistries, introduction of Oxygen into the chambers.
- Pinpoint material selection on a per application basis to maximize “cost vs. performance.”
- Replacement of polyimide for reduced cost and increased performance.
- Careful use of ceramics and Quartz, due to cost and breakage.
- Increased requirements for ionic purity due to reduced node size.

Typical Applications

- Screws and Pins
- Valve Housings
- Clamp and Trench Rings
- Shower Heads
- Various Etch and CVD Parts

Competitive Quartz vs. Semitron® MPR 1000

Competitive Quartz (left) is much more brittle than Semitron® MPR 1000 (right) often chipping in vacuum chambers

Introducing - Semitron® MPR 1000

Semitron® MPR 1000 was developed to provide engineers with a viable polymer-based option when confronted with the increasing demands in vacuum plasma based chamber design due to use of Oxygen to clean the chamber and the rapidly increasing electrode power.

Product Features

- Outstanding plasma resistance in Oxygen plasma, approaches Quartz.
- 12-25X* better than polyimide in Oxygen plasma.
- Exceptional chip resistance, durability, and machinability compared to Quartz.
- Lowest overall cost of any polymer solution.
- Excellent ionic purity.

Chamber Conditions
 • 1KW • CF 1200 sccm • 0.32 Torr • 50 hours

Percent Weight Loss in Cf4 Plasma - Low Energy

- Most advanced engineering plastics perform similar in freon plasma gases.
- The mode of degradation is mechanical erosion, a function of surface hardness and type of solid, crystalline vs amorphous.

PEEK

PAI

Polyimide

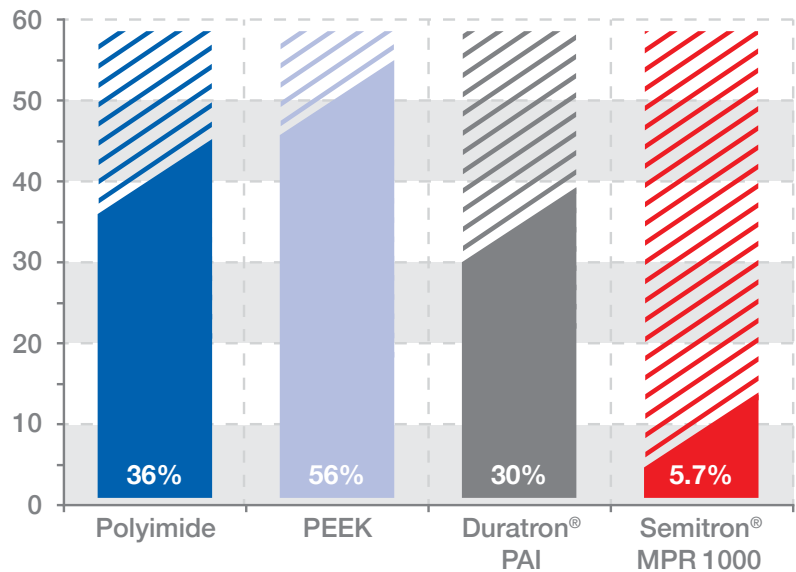

Semitron® MPR 1000

Percent Weight Loss In O2 Plasma - 2kw

- Advanced engineering plastics mode of degradation in Oxygen plasma is catastrophic oxidation.
- Semitron® MPR 1000 was developed to withstand the typical erosion experienced in Oxygen plasma chambers.
- Semitron® MPR 1000 displays 10X better results than PEEK and 6X better results than polyimide in a 2KW Oxygen plasma chamber and up to 25X better results than polyimide at 2.5KW Oxygen plasma.

Chamber Conditions
 • 2KW • O2 1200 sccm • 0.30 Torr • 50 hours • 13.56 MHz

Ionic Purity Data

	Aluminum (Al)	Barium (Ba)	Calcium (Ca)	Chromium (Cr)	Copper (Cu)	Iron (Fe)	Lead (Pb)	Lithium (Li)	Magnesium (Mg)	Manganese (Mn)	Nickel (Ni)	Potassium (K)	Sodium (Na)	Strontium (Sr)	Titanium (Ti)	Zinc (Zn)
